Attn: Mary Ann Wright, Reclamation Biologist

Dear Ms Wright:

In referance to your letter dated June 24, 1980; We are preparing a map showing the intended trenching and mining of the property. This will necessitate a field visit to the property this comming week. This would be an opertune time to meet your people on-site and go over our mode of mining and restoration with them. July 3rd would be much the better of the two tenative dates suggested.

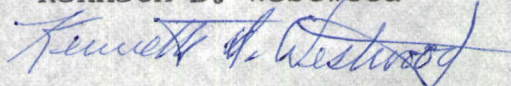

In so far as a restoration time table; We plan on trenching a maximum width of 15 to 20 feet with a track mounted backhoe. After ore removal, while the back hoe is still in place we intend to backfill and restore the area before moving to a second station, etc. All backfilling and restoration would be complete withing a day after trenching has been done. Trenches would be no more than 20 feet in length and 15 feet in width before restoration of that area was completed.

Actually the restoration plan suggested would do much to restore the area as it now exsists. Considerable surface disturbance has been done by prior activities and would be benificially effected by our present intended plan of restoration.

We will plan on meeting your people at the site on July 3rd and will awaite confermation of that date by you.

Sincerely

Kenneth D. Westwood
